10.1 Not an Investment Solicitation

10.2 Limitation of Legal Effect

10.3 Risk Disclosure

10.4 Regional Regulatory Differences

10.5 Uncertainty of Future Plans

[Appendix] User Journey & Workflow (Summary)

1. ABSTRACT

1.1 Vision Statement

Meta HiNT is a digital trust infrastructure that combines Decentralized Identifiers (DID), Verifiable Credentials (VC), and multi-data AI to simultaneously realize personal data sovereignty and real-world utility. It applies a dual structure of off-chain encrypted storage and on-chain integrity hashing, operating on a consent ledger that records selective disclosure and withdrawal.

On this foundation, Meta HiNT organically connects Proof of Health (PoH) rewards, connected vending integrated with hospitals, pharmacies, fitness centers, and retail, a network of credentialed professionals, and a Metaverse Health Twin to complete the user journey of recommendation–purchase–consultation–reward.

The entire process adheres to the compliance-by-design principle, aligned with regulations such as GDPR and PIPA, ultimately aiming to realize a future in which users lead consent, sharing, and rewards within an interoperable ecosystem.

1.2 Problem Recognition

Centralized, platform-centric authentication and data structures have led to repetitive registrations and excessive data collection, increasing the risks of data breaches and misuse. Even within the blockchain ecosystem, the absence of trust and compliance, along with limited real-world utility, has remained a critical challenge.

1.3 Meta HiNT's Approach

- **DID/VC-Based Decentralized Identity:** Users can prove their credentials through selective disclosure only when necessary, with the ability to revoke access at any time.
- **Multi-Data Embedding AI:** Clinical, wearable, purchase, survey, and behavioral data are fused through cross-modal integration to deliver explainable personalization.
- **On/Off-Chain Separation:** Sensitive data is securely stored off-chain with encryption, while only integrity hashes are anchored on-chain.

- Metaverse Health Twin: Indicators, missions, consultations, and consent controls are visualized through an avatar-based interface, enhancing motivation and user engagement.

1.4 Expected Outcomes

It strengthens privacy protection and self-sovereignty, enhances precision personalization, ensures compatibility with global standards, expands real-world utility, and reinforces scalability through partnerships.

1.5 Key Services (Summary)

- AI-Driven Personalized Health Recommendations
- Medication-Induced Nutrient Deficiency Supplementation Program
- Personalized Health Supplement Vending (Connected Vending Machines)
- Expert Network (Nutritionists, Pharmacists, Physicians)
- Data Rewards & Research Cohorts (Opt-In Participation)
- Metaverse Health Twin (Visualization of indicators, missions, consultations, and consent control)
- Global Health Passport (QR) & Verification Services (DID/VC with verifiable receipts)
- AI Health Reports (Premium) – Advanced interpretation and coaching

2. MARKET BACKGROUND AND NECESSITY

2.1 The Crisis of Digital Trust

Massive personal data breaches and data monopolization have resulted in the loss of user control and a profound crisis of trust. In sensitive domains such as healthcare, regulatory demands are becoming increasingly stringent.

2.2 Opportunities in Blockchain and Web3

Blockchain reconstructs trust through transparency and immutability. In particular, DID/VC standards serve as a cornerstone for simultaneously realizing user sovereignty and interoperability.

2.3 Global Market Trends

The DID/VC and digital identity verification market continues to experience rapid growth, driven in part by regulatory standardization efforts such as eIDAS 2.0. In addition, rising demand for KYC (Know Your Customer) and KYH (Know Your Health) across sectors such as healthcare and finance is accelerating the adoption of verifiable credentials.

2.3.1 Global Healthcare Market Trend Analysis (2025–2035)

1. Market Overview and Paradigm

The global healthcare market continues to grow steadily, driven by rapid population aging, the rising prevalence of chronic diseases, and increasing demand for personalized wellness solutions. In particular, the convergence of AI and blockchain is emerging as a key pillar in overcoming the limitations of existing healthcare systems and establishing a new digital healthcare paradigm.

AI plays a central role in disease prediction, precision diagnostics, personalized treatment, and continuous condition monitoring, while blockchain ensures data integrity, traceability, and security, enabling trust-based data exchange among healthcare providers, consumers, and insurers.

2. Market Size and Growth Forecast (2023–2035)

- Global Healthcare Market Size in 2023: approximately USD 10 trillion
- Compound Annual Growth Rate (CAGR, 2023–2035): approximately 8.5%
- Projected Market Size in 2025: approximately USD 11.76 trillion
- Projected Market Size in 2030: approximately USD 17.74 trillion
- Projected Market Size in 2035: approximately USD 26.9 trillion

AI Healthcare Sector

- Market Size in 2025: approximately USD 6.8 billion
- Projected Market Size in 2030: over USD 20 billion
- CAGR (2025–2030): 24.3%

Blockchain Healthcare Market

- Market Size in 2025: approximately USD 11.0 billion
- Projected Market Size in 2030: approximately USD 23.0 billion
- CAGR (2025–2030): 15.6%

Precision Nutrition Market

- Market Size in 2025: approximately USD 1.3 billion
- Projected Market Size in 2030: over USD 5.0 billion
- CAGR (2025–2030): 31.3%

2.4 Competitor Analysis

Company	Technology Focus	Weaknesses / Limitations	Meta HiNT's Advantage
WHOOP	Wearable-centric	Limited personalization, insufficient AI-driven analysis	Advanced AI-driven recommendations + integration with health vending
Babylon Health	Telemedicine & chatbot services	No blockchain adoption, data reliability concerns	Blockchain-based data security
Ada Health	Symptom-based AI diagnostics	Lack of data personalization, difficulty integrating biometrics	Integrated analysis of personal health data

Teladoc Health	Telemedicine & mental health	High costs, concerns over data protection	Cost-efficient personalized solutions + user reward system
Nutrigeno mix	DNA-based nutrition analysis	Limited AI capabilities, narrow application scope	AI + DNA-based precision nutrition recommendations

Meta HiNT's Core Competencies

- **Multi-Data AI & Predictive Modeling:** Integrates clinical, wearable, purchase, and behavioral data to generate real-time, personalized risk assessments, supplementation guidance, and behavioral recommendations.
- **DID/VC + Consent Ledger:** Ensures data integrity and traceability through selective disclosure/withdrawal, issuer verification, and revocation management based on Status List 2021.
- **ATL (Adaptive Trust Layer):** Enhances data reliability by applying a 0–1000 trust score and policy packs, enabling minimal disclosure/least privilege, as well as differentiated grading and reward weighting.
- **Connected Vending Distribution:** Links personalized nutrition recommendations directly to on-site purchases, verifiable credential receipts, and real-time PoH (Proof of Health) updates.
- **Participation Reward Structure (MTHT):** Distributes rewards through PoH, staking (+2–10% boost & DAO confirmation), and premium data marketplace revenue sharing.
- **Metaverse Health Twin:** Visualizes indicators, missions, and consultations in a 3D UI, while supporting on-site verification via integration with a Global Health Passport (QR).

2.5 Summary of Differentiation Strategy

Unlike existing platforms that remain technically fragmented or limited to generic approaches, Meta HiNT integrates and analyzes multi-source data to deliver actionable feedback, instantly linking it to real-world purchases, consultations, and rewards. Furthermore, built on DID/VC-based identity and the ATL scoring system, Meta HiNT ties user participation to rewards (MTHT) and graded engagement. Through the Metaverse Health Twin, it visualizes health status, missions, and consent processes, delivering a highly immersive and user-centric experience.

3. TECHNOLOGY VISION AND ARCHITECTURE

3.1 Technology Vision

Meta HiNT places DID/VC at the core of trust, while designing AI, security, and compliance on an equal footing. The ultimate goals are “secure personalization” and “regulatory-compliant data utilization.”

3.2 System Architecture Overview

- Infrastructure Layer: Polygon L2/EVM, HSM-based key management, IPFS/distributed storage, and event bus.
- Identity Layer: DID issuance/management, VC creation/verification, W3C standards, SD-JWT/BBS+ compatibility, with support for revocation and expiration.
- Service Layer: DID/VC login, consent management, recommendation APIs, connected vending (kiosk + VC receipts), and dApp SDK.
- Governance Layer: DAO proposals/voting, budget execution, and operation of an attestation registry.

3.2.1 DID/VC Standards and Methods

- Standards Compliance: W3C VC 2.0 + SD-JWT (Selective Disclosure), issuance via OIDC4VCI, and revocation/status management with Status List 2021.

- DID Methods: Long-term user identifiers via did:ion, lightweight identifiers via did:key; initial institutional adoption with did:web transitioning to did:ion.
- Initial VC Types: KYC VC, medical VCs (tests/diagnostics/vaccinations, etc.), device attestation VC, lifestyle VC, and professional credential VC.

3.2.2 Adaptive Trust Layer (ATL)

The Adaptive Trust Layer (ATL) is a dynamic trust framework that adjusts the required level of proof and scope of disclosure according to context, risk level, and jurisdiction. It orchestrates DID/VC, consent ledger, selective disclosure, revocation, PoH attestations, and issuer reputation through a policy-based mechanism, thereby realizing the principles of minimal disclosure and least privilege.

ATL Scoring Model (0–1000)

Factor	Weight	Description
Source Reliability	35%	Higher scores for hospitals, accredited institutions, and certified devices.
Recency	15%	Additional weight for the most recent and up-to-date data.
Consistency	20%	Alignment and coherence across multiple data sources.
Habit Adherence	15%	Rewards for consistent health practices and sustained compliance.
Outcome Improvement	10%	Positive trends in indicators such as blood pressure or sleep quality.
Staking Boost	5%	Minor bonus when staking, subject to DAO-imposed upper limits.

- DID Methods: Long-term user identifiers via did:ion, lightweight identifiers via did:key; initial institutional adoption with did:web transitioning to did:ion.
- Initial VC Types: KYC VC, medical VCs (tests/diagnostics/vaccinations, etc.), device attestation VC, lifestyle VC, and professional credential VC.

3.2.2 Adaptive Trust Layer (ATL)

The Adaptive Trust Layer (ATL) is a dynamic trust framework that adjusts the required level of proof and scope of disclosure according to context, risk level, and jurisdiction. It orchestrates DID/VC, consent ledger, selective disclosure, revocation, PoH attestations, and issuer reputation through a policy-based mechanism, thereby realizing the principles of minimal disclosure and least privilege.

ATL Scoring Model (0–1000)

Factor	Weight	Description
Source Reliability	35%	Higher scores for hospitals, accredited institutions, and certified devices.
Recency	15%	Additional weight for the most recent and up-to-date data.
Consistency	20%	Alignment and coherence across multiple data sources.
Habit Adherence	15%	Rewards for consistent health practices and sustained compliance.
Outcome Improvement	10%	Positive trends in indicators such as blood pressure or sleep quality.
Staking Boost	5%	Minor bonus when staking, subject to DAO-imposed upper limits.

Grade/Permission Linkage

Based on the ATL score, service tiers (Bronze to Platinum), data access levels, and reward weightings are applied differentially, ensuring a risk-adjusted and merit-based participation structure.

3.3 Differentiated Technology Highlights

- Multi-Data Embedding (7 patents, including international filings): Implements modal encoders → attention-based fusion → individualized baselines, providing reliability scores and explainability.
- Safety Guardrails: Supports automated detection of drug–supplement interactions and escalates red flags to ensure user safety.
- Proof of Health (PoH): Certifies beneficial activities such as steps, medication adherence, medical checkups, and purchases as verifiable credentials (VCs), linking them to rewards and staking multipliers.
- Metaverse Health Twin: Delivers a spatial UI for real-time indicators, missions, and consultations, while controlling permissions, duration, and purpose at the consent flow.
- On/Off-Chain Design: Applies off-chain encryption (AES-256 + KMS) with on-chain integrity hashes, following a zero-knowledge (ZK)–friendly roadmap.

3.4 Key Services

(1) AI-Powered Personalized Recommendation Engine

- Scope of Analysis
Analyzes clinical and diagnostic data, prescriptions/medication adherence, wearable data (sleep, HRV, steps), purchase and intake records, and survey/lifelog inputs.
- Recommendation Outputs
Provides insights on deficiency/excess risks, recommended nutrients with dosage and timing, contraindication alerts (drug–ingredient interactions), and reliability/evidence metadata.
- Safety Measures
Integrates a drug–nutrient interaction database, applies clinical review rules, and connects users with experts in cases of red-flag alerts.

(2) Medication-Induced Nutrient Deficiency Supplementation Program

- Concept: Proposes supplementation protocols that account for nutrient losses caused by specific medications.

- Personalization: Adapts recommendations based on dosage, intake schedule, formulation options (capsule/powder/chewable), and individual meal/sleep rhythms.
- Tracking: Reflects adherence in PoH (Proof of Health), provides streaks/badges, and issues refill reminders.

(3) Expert Network (Nutritionists, Pharmacists, etc.)

- Credential Verification: Operates a VC-based registry and issues VCs for sessions/recommendations.
- Session Types: Offers remote, in-person, and metaverse-based consultations (including posture and routine coaching).
- Settlement: Supports performance-linked compensation options tied to adherence and measurable health improvements.

(4) Data Rewards & Research Cohorts (Opt-In)

- Principles: Operates under the principles of de-identification, purpose limitation, and revocability, ensuring user control over data usage.
- Rewards: Provides MTHT-based incentives proportional to data quality, novelty, and utility, with transparent disclosure of DAO budget execution.

4. TOKENOMICS

4.1 Basic Token Information

- Token Name / Ticker: Meta HiNT / MTHT
- Network: Polygon (ERC-20 compatible)
- Total Supply: 1,000,000,000 MTHT (fixed supply)
- Distribution Mechanism: Smart contract-based, phased release

4.2 Token Distribution Structure

Category	Allocation	Token Amount	TGE	Cliff	Vesting	비고
Team & Advisors	15%	150,000,000	0%	2 m	48 months (monthly)	5-year total period : retention mechanism for key personnel
Foundation Reserve	20%	200,000,000	0%	6 m	48 months (monthly)	Operations, contingency, R&D: subject to annual spending cap
Marketing & Partnerships	15%	150,000,000	10%	0 m	36 months (monthly)	Campaigns, rewards, partners; quarterly disclosure of allocation
Community & DAO	20%	200,000,000	0%	0 m	Streaming / Grants	DAO-approved execution; annual disbursement ≤25%
Ecosystem Subsidy	15%	150,000,000	0%	3 m	48 months (quarterly)	Support for builders, nodes, and research initiatives

Public Sale	10%	100,000,000	25%	0 m	12 months (monthly)	Subject to KYC and jurisdictional restrictions
Private Sale	5%	50,000,000	10%	0 m	18 months (monthly)	Primarily for strategic partners

4.3 Circulation and Lock-Up Policy

- TGE Unlock: Only Public Sale, Private Sale, and Marketing/Partnership allocations are partially unlocked at TGE; all other pools start at 0%.
- Monthly Unlocks: Tokens are released linearly on a monthly basis according to each pool's vesting schedule, with no over-allocation permitted.
- Quarterly Disclosure: Remaining balances, upcoming unlock schedules, utilization, and circulating supply estimates will be disclosed on a quarterly basis.
- Wallet Guardrails: Managed under multi-signature and DAO control; buybacks and LP provisions require separate DAO approval.
- Team & Advisor Allocations: Subject to a minimum two-year lock-up before distribution.
- Foundation Reserve: Deployed only under major decisions and DAO approval.
- Marketing Allocation: Dedicated to exchange listings, global campaigns, and incentive programs.
- Sale Allocations: Distributed progressively before and after listing to ensure stable market entry.

4.4 Token Utility

- The MTHT token functions not only as an investment asset but also as a core operational resource of the Meta HiNT ecosystem.

- Governance: Participation in DAO proposals and voting.
- Service Access: Authentication via DID/VC-based identity services and usage of ecosystem dApps.
- Staking: Contributes to network security while generating rewards.

4.4.1 Token Utilities (7 Types)

1. Service Tiering (Bronze–Platinum) — Expands access to consultations, discounts, and priority services.
2. Reward Weighting — Actions are rewarded proportionally to user tier and ATL score.
3. Premium Data Marketplace — Transactions are settled in MTHT, with a portion of revenues distributed to contributors.
4. Insurance & Wellness Partnerships — Higher tiers unlock benefits such as insurance premium discounts and reward coupons.
5. Staking → Score Boost — Staking periods apply an ATL score boost of +2–10% (DAO-determined).
6. Global Health Passport (QR) — Portable verification bundling DID, required VCs, and user tier.
7. AI Health Reports (Paid) — Advanced interpretation and coaching services are purchased in MTHT, with tier-based discounts.

4.5 Differentiation Points

Meta HiNT's tokenomics emphasizes:

- Utility-Centric Design to minimize securities risk,
- DAO-Based Transparent Fund Management, and
- Balanced Allocation across marketing, development, and governance.

4.6 Burn / Fee Policy

Policy Framework: A portion of protocol revenues from markets, AI services, and consultations may be periodically burned subject to DAO approval.

- Effect: Gradual reduction of circulating supply to mitigate value dilution.
- Guardrails: Prior evaluation of financial and liquidity impacts; advance disclosure of burn ratio, frequency, and triggers; mandatory quarterly reporting.

5. ROADMAP

5.1 Development Roadmap Overview

1. It pursues feasibility and sustainability as guiding principles, achieving milestones through a phased, step-by-step approach.

5.2 Phased Development Plan

Phase 1 (2025 – Completed / In Progress)

- Launch of the Meta HiNT App (Beta → Full Release)
- Establishment of initial partnerships and community build-up
- Exchange listing to begin brand recognition and market expansion

Phase 2 (2026–2027)

- Implementation of DID/VC modules on the Polygon network
- Listings on major exchanges to expand liquidity and visibility
- Execution of global marketing campaigns and community engagement events

Phase 3 (2027–2028)

- Official launch of DAO governance functions
- Expansion of the dApp ecosystem with developer grant programs
- Extension of DID/VC applications into finance, education, and entertainment sectors
- Support for cross-chain interoperability (Ethereum, Solana, etc.)

Phase 4 (2029 and Beyond)

- Expansion of global partnerships and establishment of regulatory-compliant infrastructure
- Consolidation of DAO-based autonomous governance
- Transformation of the MTHT token into a global utility asset

6. REGULATORY AND COMPLIANCE STRATEGY

6.1 Understanding the Regulatory Environment

Meta HiNT recognizes the regional diversity and rapid evolution of regulatory frameworks. Its foundation is a utility token model and a data protection–centric architecture.

6.2 Core Compliance Principles

- **Utility-Centric Design:** Token use is focused on service access, governance, and staking, minimizing securities risk.
- **DAO & On-Chain Transparency:** Ensures transparent fund management and governance.
- **Global Data Protection Alignment:** Adheres to GDPR, PIPA, and equivalent global standards.
- **Local Licensing:** Obtains licenses where necessary to ensure full compliance.

6.3 Regional Strategies (Summary)

- **South Korea:** Compliance with PIPA, the Act on Reporting and Use of Specific Financial Transaction Information (Travel Rule, ISMS), and restrictions on medical advertising.
- **Indonesia:** Alignment with PDP Law 27/2022, telemedicine guidelines, and ongoing regulatory transition of digital asset oversight under OJK.
- **Philippines:** Compliance with the Data Privacy Act, DOH–NPC telemedicine guidelines, and BSP VASP licensing.

- Vietnam: Alignment with PDPD (Decree 13/2023), telemedicine circulars, and adaptation to emerging digital asset research/regulatory frameworks.
- EU/EEA: Full compliance with GDPR, assessment under MiCA (utility tokens, asset-referenced tokens, e-money tokens), and evaluation of relevance under the EU AI Act and Medical Device Regulation (MDR).
- United States: Compliance with HIPAA (where applicable), CCPA/CPRA, FDA SaMD guidance, and financial oversight including FinCEN, state-level MTL requirements, and OFAC sanctions rules (noting state-by-state variations).

6.4 Internal Governance Framework

- Legal Advisory Network: Provides continuous oversight and guidance on evolving global regulatory landscapes.
- Risk Management Committee (DAO Subcommittee): Monitors systemic, financial, and compliance-related risks, ensuring proactive mitigation.
- Policy Feedback Loop: Enables rapid updates to policies and protocols in response to regulatory changes, ensuring timely adaptation and compliance.

7. PARTNERSHIPS AND COLLABORATION STRATEGY

7.1 Necessity of Strategic Partnerships

Meta HiNT seeks to build a multi-dimensional collaboration model that extends beyond the capabilities of a single project. This model encompasses technology integration, service delivery, regulatory alignment, and market expansion, ensuring resilience and scalability across diverse ecosystems.

7.2 Key Areas of Collaboration

Meta HiNT establishes partnerships across multiple domains:

- Technology: DID/VC frameworks, smart contracts

- Technology: DID/VC frameworks, smart contracts
- Services: Wallets, payment systems, and dApps
- Exchanges & Financial Institutions: Listings and liquidity provision
- Regulation & Legal Advisory: Compliance, licensing, and legal alignment
- Community Partners: Engagement, growth, and ecosystem adoption

7.3 Global Network Expansion Strategy

- Initial Phase: Build trust through infrastructure and exchange partnerships
- Expansion Phase: Extend collaborations with service and data-utilization enterprises
- Regional Differentiation:
 - Asia → Technology and exchange-driven growth
 - North America / EU → Regulation and data protection leadership
 - Emerging Markets → Deployment of accessible, cost-effective services

7.4 Differentiation Points of Collaboration

DAO-Based Partnership Management: Community-driven proposals and approvals

KPI-Linked Rewards: Performance-based incentives for partners

Insider Ecosystem Model: Partners function as active operators within the Meta HiNT ecosystem

7.5 Strategic Partners

LogSync Co., Ltd.: AI solutions development

Glink Co., Ltd.: Collaboration on building online and offline ecosystems

Future Guarantee Finance Co., Ltd.: Financial partnership for sustainable growth

8. REGULATORY AND RISK MANAGEMENT

8.1 Regulatory Environment Analysis

- Meta HiNT adopts a sandbox- and advisory network–driven strategy to respond to both the regional variations and the rapid pace of regulatory changes, ensuring adaptability and resilience.

8.2 Strategies for Minimizing Regulatory Risk

- Reinforce utility-focused design to mitigate securities classification risk
- Maintain DAO-based transparent operations
- Engage with local legal advisors for jurisdiction-specific compliance
- Leverage regulatory sandboxes to test and refine services under supervision

8.3 Security Risk Management

- Conduct external audits of smart contracts
- Implement HSM-based key management
- Minimize data storage by relying on DID/VC frameworks
- Establish disaster recovery (DR) systems and emergency response protocols

8.4 Market and Business Risk Management

Address risks of volatility, competition, and sustainability through:

- Liquidity partnerships
- DAO stabilization funds
- Differentiation via DID/VC identity, PoH incentives, and Metaverse Health Twin services

8.5 Differentiation in Risk Management Framework

- Preventive Approach: Anticipates risks rather than reacting to them
- DAO-Based Transparency: Open and community-driven governance processes
- Regular Updates: Continuous adaptation to regulatory and technological changes

9. TEAM & ADVISORS

Team

- CEO : [To be Appointed]
- COO : [To be Appointed]
- CTO : [To be Appointed]

Advisors

- Soo-Il Lee — CEO, LogSync Co., Ltd.
- Hyun-Dong Shin — Chairman, Korea Digital Asset Economic Association
- Jung-Hoon Lee — Chairman, Glink Co., Ltd.

10. DISCLAIMER

This whitepaper has been prepared to describe the vision, technical architecture, tokenomics, roadmap, and business direction of the Meta HiNT project. It is intended solely for informational purposes and includes the following disclaimers:

10.1 Not an Investment Solicitation

This whitepaper does not constitute an issuance of securities, an investment solicitation, or financial advice. The MHT token is a utility token designed for use within the Meta HiNT ecosystem and does not guarantee or promise investment returns.

10.2 Limitation of Legal Effect

This whitepaper does not constitute a legally binding contract and its contents are subject to change without prior notice as the project develops. Depending on national regulatory environments and legal requirements, certain services and features may be restricted or adjusted.

10.3 Risk Disclosure

Virtual assets involve high volatility and regulatory uncertainty, and participants must fully understand the financial risks associated. Meta HiNT (MHT) assumes no responsibility for losses arising from external factors such as technical failures, market conditions, or policy changes.

10.4 Regional Regulatory Differences

Due to differences in national laws and regulations, the acquisition, holding, or use of MHT tokens may be illegal or restricted in certain jurisdictions. Participants are solely responsible for reviewing and complying with the applicable laws in their respective jurisdictions.

10.5 Uncertainty of Future Plans

The roadmap and business plans described in this document are based on current forecasts and targets, and may change during project execution. Meta HiNT (MHT) reserves the right to adjust its plans in response to changes in market conditions, technology, or regulatory environments.

[APPENDIX] USER JOURNEY & WORKFLOW (SUMMARY)

A) Connected Vending

• DID Login / Consent → Data Integration → AI Recommendation → Vending / Mall Payment → VC Receipt Issuance → PoH / Rewards → Off-Chain Storage + On-Chain Hash Anchoring

B) Expert Network

• Reservation / Consent → Credential VC Verification → Deposit / Payment → Session (Remote / Metaverse) → Recommendation VC / PoH Issuance → Settlement (Performance-Linked)

[Appendix] Glossary – Standard and Proprietary Terms

- Adaptive Trust Layer (ATL): A trust layer that dynamically adjusts the level of proof and disclosure scope based on context, risk, and jurisdiction, managed via Trust Levels (T0–T4) and Policy Packs.
- Attestation: Signed data verifying facts, actions, or credentials (e.g., PoH activities, license VC).
- BBS+: A signature scheme supporting selective disclosure while reducing linkability risks.
- Consent Ledger: A ledger that records consent, withdrawal, and selective disclosure events.
- DAO: A Decentralized Autonomous Organization executing proposals, voting, and execution fully on-chain.
- DID (Decentralized Identifier): Self-created and managed identifiers without centralized registration (e.g., did:ion, did:key, did:web).
- DPIA / DSR: Data Protection Impact Assessment / Data Subject Rights (access, correction, deletion requests).
- HSM / KMS: Hardware Security Module / Key Management Service.
- Health Twin: A metaverse-based personal health twin UI visualizing indicators, missions, consultations, and consent control.
- IPFS: InterPlanetary File System, used for distributed off-chain data storage.

- Issuer / Holder / Verifier: Roles within the VC ecosystem — credential issuer, holder, and verifier.
- KYC: Know Your Customer (identity verification).
- KYH: Know Your Health, verification based on health status and behavioral data.
- Liveness: Verification of whether a real user is present, preventing deepfake or replay attacks.
- MDE (Multi Data Embedding): An AI technique that embeds heterogeneous data into vectors and fuses them for integrated analysis.
- MiCA / eIDAS 2.0: EU regulatory frameworks for crypto-assets (MiCA) and electronic identification & trust services (eIDAS 2.0, covering VC and e-signatures).
- OIDC4VCI / OID4VP: OpenID-based protocols for VC issuance (VCI) and verifiable presentation (VP).
- OFAC / MTL: U.S. Office of Foreign Assets Control (sanctions/remittance regime) and state-level Money Transmitter License requirements.
- PIPA / GDPR / PDPA / PDPD / CCPA: Representative data protection regulations from Korea (PIPA), EU (GDPR), Singapore (PDPA), Vietnam (PDPD), and California, U.S. (CCPA/CPRA).
- PoH (Proof of Health): A framework for verifying and issuing VCs/attestations that represent health-related beneficial actions and outcomes.
- Policy Pack: A bundle of policies within ATL that defines proof requirements, retention periods, and jurisdictional exceptions for each trust level.
- RAG (Retrieval-Augmented Generation): An AI approach in which models generate responses by incorporating information retrieved from an external knowledge base.
- Revocation / Status List 2021: A global standard for managing the validity and revocation status of VCs.
- SD-JWT / Selective Disclosure: A JWT-based framework for VCs that enables partial claim disclosure.
- Trust Level (T0–T4): ATL-defined levels of proof requirements depending on risk and regulatory context.
- VC (Verifiable Credential): A digitally issued, held, and verifiable credential supporting cryptographic validation.

- VC Receipt: A VC issued as proof of a transaction outcome, such as a purchase or consultation.
- VASP (Virtual Asset Service Provider): An entity providing crypto-asset services, subject to licensing/registration in certain jurisdictions.
- ZK Proofs (Zero-Knowledge Proofs): Cryptographic proofs that verify facts without disclosing the underlying sensitive values.
